

You're dealing with a fragmented automation ecosystem that needs to be stabilized and scaled, specifically regarding the transition of reconciliation bridges from test to production. I specialize in exactly this type of infrastructure cleanup—taking messy, incomplete pipelines and hardening them for production use. I have extensive experience navigating Zoho's API ecosystem via OAuth and architecting resilient n8n/Make workflows that turn manual bottlenecks into automated assets.

Regarding your lead sourcing and CRM sync requirements, I have built similar production-grade pipelines for lead intake, data enrichment, and automated sequence logging. You can see how I structure these flows in this [HR Assistant Agent walkthrough](<https://www.loom.com/share/91f463ab443a466c9a0a3f1f7e736411>), which demonstrates the exact logic required for CRM logging and pipeline updates from webhook events.

For your accounting needs, I have deep experience building out supplier-bill and COGS automation. Having worked with Zahara Software on production AP and accounting operations, I understand the critical nature of bank/payment reconciliation bridges. I am fully prepared to handle the Stripe-to-Zoho sync and the infrastructure deployment on Render to ensure your financial data is accurate and automated across your stacks.

Setting up a parallel automation ecosystem for your new business unit is a challenge I'm well-versed in. My approach centers on a 10-week agile roadmap that prioritizes high-value integrations first, starting with core operational pipes, webhook setups, and custom fallback error handling. I treat these builds as production-level software, ensuring container security and robust credential management from day one.

I am available to start immediately and am comfortable jumping into your Zoho sandbox or Render environment to run a paid trial task. This will allow us to pressure-test my approach to your specific reconciliation logic before committing to the full three-month rollout.

Are you free for a 15-minute call this week to review the current state of your backlog and map out the phase one transition for your reconciliation pipelines? I'd like to see the existing architecture to ensure we hit the ground running.
