

Voice Agent — Bug List

For AB Ark dev team — Bland AI / AWS voice agent

This is what we've got so far, pulled together from support messages, a few call recordings, and things I've personally run into. It's not fully organized and a couple of these I haven't been able to confirm myself, so I've marked those. Let me know what you need from me to dig into any of them further.

Field	
Platform	AWS backend + Bland AI voice layer
Compiled by	Client — from support tickets, Slack messages, and personal use
Status	Not triaged. Some items confirmed, some are single reports — see Confirmed? column

#	Bug	How often	Confirmed?	Notes
VOICE / CALL BEHAVIOR				
1	Agent talks over the caller mid-response, cuts them off before they finish speaking.	Happens a lot, several complaints	Confirmed, heard it myself on a call	This is the one I most want fixed. Feels like the #1 complaint.
2	Voice sounds robotic / unnatural on longer responses.	Ongoing	Confirmed	Not urgent, but customers have mentioned it a couple of times.
3	Occasional dead air, caller goes quiet for a few seconds and it feels like the call dropped.	A handful of reports	Unconfirmed, haven't caught it myself on a recording	Might be related to #1 (people start talking again after the silence, sounds like an interruption).
4	Agent mishears or misunderstands common phrases (e.g. yes/no confusion, name spelling).	Occasional	Confirmed — a few recordings show this	Not sure if this is a Bland setting or something on our side.
CALL FLOW / LOGIC				
5	Call sometimes ends abruptly without a proper closing / handoff message.	A few times a week	Confirmed	Customer just hears the line go dead.
6	Agent sometimes loops back to an earlier question it already asked and got an answer to.	Occasional, a few reports	Unconfirmed — only heard about this secondhand	One support message mentioned it, I haven't personally seen it.
7	Certain requests that should route to a human don't — caller gets stuck with the AI.	Reported twice	Unconfirmed	Need to figure out what triggers this before we can even describe the fix.
DATA / BACKEND				
8	A couple of calls seem to have created duplicate entries / records on our side.	Rare, noticed twice	Confirmed — saw it in our system directly	Not sure if it's retries or something else. Flagging because it affects billing/records.
9	Some call transcripts are missing or incomplete when we go to look them up.	Intermittent	Confirmed	Makes it hard to check on other issues when this happens.
GENERAL / POLISH				

#	Bug	How often	Confirmed?	Notes
10	No easy way for us to see a list of recent calls / issues without digging through Bland's dashboard.	N/A — ongoing gap	N/A	Not a “bug” exactly, more a gap. Mentioning it because it's slowing down how fast we notice problems.

Let me know which of these you want to start on first, and what you need from me, access, specific call examples, anything like that.
