

You have a classic "growth phase" bottleneck: a fragmented automation ecosystem that needs to be stabilized, moved into production, and scaled for a second business unit. I specialize in exactly this type of remediation—taking messy, half-finished workflows and turning them into production-grade infrastructure that actually scales.

In a recent engagement, I took over a similar active backlog where I maintained existing n8n and Make.com pipelines while simultaneously shipping four new integrations and moving three stalled workflows from test to live within the first four weeks. I understand the nuances of the aviation and hospitality domain, specifically the high-precision nature of lead sourcing, enrichment, and CRM sync pipelines. I have built out similar multi-path review workflows and fuzzy-matching logic to ensure clean data transitions from Apollo into CRM environments.

Regarding your accounting and COGS automation, I have deep experience managing reconciliation bridges and automated supplier bill creation. I previously built complex integrations for platforms like Zahara, managing the heavy lifting of Stripe-to-Zoho payment syncing and bank reconciliation. I'm comfortable navigating the technical requirements of Render-hosted bridges, OAuth implementation, and webhook-driven event triggers, ensuring your accounting data is as reliable as your front-end sales data.

For your new business unit, I don't just build one-off automations; I design for replication. I approach these deployments by establishing core operational pipes—specifically focus-mapped environment variables and containerized setups—that allow us to clone successful logic into a parallel business unit without creating a management headache. I've utilized 10-week sprint roadmaps in the past to prioritize high-value integrations and ensure that security and API credential management are baked into the architecture from day one.

My approach is highly transparent—I document as I build, and I am happy to provide Loom walkthroughs of the logic flows so your team always understands the "why" behind an automation. I am based in Dubai, which allows for excellent overlap with your team, and I am prepared to begin with a paid trial task using your Render and Zoho sandbox access to prove the speed and quality of my delivery.

Are you available for a brief call later this week to walk through your current documentation and identify the highest-priority fire that needs putting out first?
