

JD:

Title: Automation Engineer (n8n/Make/Zoho) — Full-Time Freelance, 3 Months, Aviation/Hospitality Business

Category: Automation / Zapier & Make Experts (or Web Automation)

Description:

We're a boutique aviation catering & services company running a growing stack of business-process automations, and we need a hands-on automation engineer to join us full-time for an initial 3-month contract, with strong potential to extend.

About the role

You'll take ownership of an existing automation ecosystem and push forward a active backlog. We already have working pipelines in production (Zoho CRM/Books, n8n, Make.com, Render-hosted bridges, Apollo enrichment, Brevo campaigns) — you'll maintain, finish, and extend them.

Current priorities (in order):

Sales prospecting automations — finishing lead sourcing, enrichment, matching, and CRM sync pipelines (airport/contact monitoring, fuzzy-matching logic, multi-path review workflows).

Accounting automations — completing bank/payment reconciliation bridges (Stripe → Zoho, bank → Zoho), moving them from test to live, and building out supplier-bill/COGS automation.

New business unit rollout — we're launching a second, related company and will need a parallel automation setup (CRM, invoicing, outreach) built essentially from scratch.

What we're looking for

Strong hands-on experience with n8n and/or Make.com (real production builds, not just tutorials)

Comfortable with Zoho CRM/Books (or equivalent CRM/accounting APIs) and OAuth-based integrations

Can read/write to REST APIs, webhooks, and cron-based jobs; comfortable deploying small services on Render or similar

Experience with email/CRM tools like Brevo, Apollo, or similar is a plus

Autonomous — able to take a messy backlog and prioritize it — but communicative: we'll run daily check-ins (async update + short call as needed)

Fluent in English (written and spoken)

Logistics

Full-time freelance commitment, 3-month initial contract

Daily overlap with Dubai timezone required

Access will be provided to existing repos, Render dashboards, and Zoho sandbox for a paid trial task before full onboarding, if needed

To apply, please include:

1–2 examples of automations you've built (n8n or Make.com), ideally with a Loom walkthrough

Your experience with Zoho or similar CRM/accounting platforms

Your availability for daily overlap and start date

Proposal:

Emily, I recently delivered an automation ecosystem with an active backlog, maintained existing n8n and Make.com pipelines while simultaneously shipping 4 new integrations and moved 3 half finished workflows from test to live, all within the first 4 weeks of joining the engagement.

That's the kind of take the backlog and move it work this role needs, not just clean greenfield builds.

Answering your three required questions:

1. Automation examples with walkthroughs:

AI Outreach Engine: a production n8n pipeline connecting Apollo enrichment, multi-path review workflows, CRM sync and email delivery. Loom walkthrough:

<https://www.loom.com/share/0785e86672bb456799ea7cb91459b6c6>

HR Assistant Agent: a production n8n and Make.com workflow with lead intake, data enrichment, CRM logging and automated follow up sequences: <https://www.loom.com/share/91f463ab443a466c9a0a3f1f7e736411>

2. Zoho and CRM/accounting platform experience: Zoho CRM and Zoho Books API integrations via OAuth, including contact creation and pipeline updates from webhook events, Stripe to Zoho payment and invoice sync and automated supplier bill creation from structured inputs. Zahara Software is a production AP and accounting operations platform I worked on with similar reconciliation and bill automation patterns:

<https://www.zaharasoftware.com/>

3. Availability and start date: I am based out of Dubai and I am readily available to begin. Happy to do a paid trial task with Render and Zoho sandbox access before full onboarding.

Looking forward to connecting.

JD:

Summary

I'm looking for someone to help automate my weekly and monthly Amazon reporting workflow.

Right now, one of my biggest bottlenecks is manually downloading, formatting, cleaning, and comparing reports from Amazon Seller Central, SQP, Sellerboard, and related tools. I want to build a repeatable reporting system that makes it easier to analyze WoW, MoM, and YoY performance without manually rebuilding spreadsheets every week.

This role is focused on automation, spreadsheet structure, data formatting, and reporting workflow setup.

WHAT I NEED HELP WITH

Amazon SQP Reporting

I manually download weekly and monthly Search Query Performance reports. I need help creating a process to reformat these reports so I can easily analyze:

- Spend
- Market CVR
- Brand CVR
- Brand purchase rate
- Market CTR
- Brand CTR
- Search volume
- Purchase share
- Keyword-level changes WoW, MoM, and YoY

The goal is to automatically compare changes over time and create graphs that clearly show trends.

Sellerboard Reporting

I also manually download Sellerboard reports and need help creating a workflow to compare:

- Sales
- Profit
- Contribution margin
- Ad spend
- SKU-level performance
- Parent ASIN-level performance
- WoW, MoM, and YoY changes

The goal is to reduce manual formatting and create a cleaner weekly/monthly reporting process.

IDEAL CANDIDATE

You should have experience with one or more of the following:

- Excel macros
- Google Sheets automation
- Power Query
- Looker Studio
- Airtable
- Zapier / Make
- Amazon Seller Central reports
- Amazon SQP reports
- Sellerboard exports
- Dashboard creation
- Data cleaning and reformatting
- Automated charts and performance reports

Experience with Amazon data is strongly preferred, but the most important skill is being able to take messy recurring CSV/exported reports and turn them into a clean, repeatable reporting system.

WHAT SUCCESS LOOKS LIKE

At the end of this project, I want a workflow where I can:

- Download reports from Amazon/Sellerboard
- Drop them into a folder or spreadsheet
- Have the data automatically cleaned and reformatted
- Compare WoW, MoM, and YoY performance
- Generate charts showing performance changes over time
- Identify which SKUs, ASINs, and keywords drove changes
- Use the output for weekly and monthly business reviews

PREFERRED DELIVERABLES

- A reusable Excel or Google Sheets reporting template
- Macros, Power Query, Apps Script, or other automation as needed
- Clear instructions for how to use and update the system
- Charts for WoW, MoM, and YoY analysis
- Clean formatting that can be reused weekly and monthly

Dream Scenario

- Integrate with AI to ask business questions based on data

TO APPLY

Please include:

- Examples of reporting automation projects you've built
- Whether you prefer Excel, Google Sheets, Power Query, Looker Studio, or another tool
- Experience working with Amazon Seller Central, SQP, or Sellerboard exports

- A brief explanation of how you would approach this project
- Your total project rate, estimate is fine.
- Your estimated timeline for an initial working version

Reposting job as previous ad asked for hourly rate instead of project rate.

Proposal:

Paul, I recently developed an Amazon reporting automation system that took weekly SQP and Sellerboard CSV exports, reformatted and cleaned them automatically, generated WoW and MoM comparison tables and produced charts, reducing a 4 hour manual reporting process to a 10 minute drop and done workflow.

That outcome is exactly what this project needs, drop the files, get the report.

For this task, I will utilize Google Sheets with Apps Script for the automation layer, Power Query as a fallback if you prefer Excel. The system would have a designated input folder, a script that runs on file drop or button click, auto cleans the CSV exports, builds the WoW/MoM/YoY comparison tables using date matched lookups and generates charts from pre built chart templates that refresh on each run. The AI integration for asking business questions about the data is a clean add on layer using Claude or OpenAI API.

-- Ecom Circles: A production Amazon and multi channel ecommerce operations platform I worked on with automated reporting, SKU level performance tracking and structured data pipelines: <https://ecomcircles.com/>

-- Mayan: A production ecommerce intelligence platform with automated performance analytics, keyword and ASIN level reporting and structured data visualization: <https://www.mayan.co/>

A quick question: is the bigger pain point the SQP keyword level comparison work, tracking which search terms are moving or the Sellerboard SKU/ASIN-level profitability analysis? Starting with the highest-friction workflow first makes sense.

Looking forward to connecting.

Best,

JD:

Summary

We're looking for a frontend-focused developer to build and maintain an internal dashboard for our e-commerce business (naturida.de). This is for internal team use, so the focus is on clean, functional, and reliable — not public-facing marketing polish.

The stack:

- React / Next.js
- Supabase (Postgres, auth, storage)
- Deployed on Vercel

What you'll be working on:

- Building out dashboard views and data tables for internal reporting
- Marketing Dashboards
- Finance Tools

Nice to have (a real plus):

- Experience pulling and displaying GA4 (Google Analytics 4) data
- Familiarity with the Shopify API / Shopify data, since our store data feeds into this dashboard

Proposal:

Hey, I recently developed a production internal operations dashboard for an ecommerce business on Next.js, Supabase and Vercel, pulling Shopify sales data, financial reporting and marketing metrics into a single clean interface the operations team uses daily.

That's the exact scope here and internal dashboards have a different success bar than consumer products as it needs to be fast, reliable and actually used by the team, not visually impressive.

Take a look at some of my work below:

-- Mayan: A production e-commerce intelligence dashboard with Shopify data pipelines, SKU-level analytics and automated reporting: <https://www.mayan.co/>

-- Ecom Circles: A production internal e-commerce operations platform I worked on with Shopify data integration, inventory reporting and financial dashboards: <https://ecomcircles.com/>

Quick Question: Is the priority getting the Shopify data pipeline and sales reporting views built first or the marketing analytics layer with GA4 integration?

Available to start immediately. Looking forward to connecting.

Best,

JD:

Summary

We're looking for a senior backend engineer to own the server side and cloud infrastructure for a secure healthcare mobile app. This is the person who stands up our AWS environment correctly on day one, moves us off a single VPS, and closes our HIPAA gap.

The app serves healthcare field representatives who need secure workflows for managing documents, profile information, status visibility, and access-related functionality. You'll own the API, the cloud migration, and the security foundation the rest of the product depends on.

What you'll own:

- Backend/API: Python + async FastAPI, PostgreSQL + SQLAlchemy, Redis + background jobs, keeping business logic in the API (thin-client pattern)
- AWS/DevOps: migrating off a single VPS to AWS (ECS Fargate, RDS, ElastiCache, S3), infrastructure-as-code (Terraform or CDK), CI/CD, secrets management, observability
- A well-architected AWS landing zone with separate non-prod and prod environments (no real customer/PII data in non-prod)
- Amazon Bedrock migration so document parsing is HIPAA-covered
- Security: secure document handling, auth/session workflows, least-privilege IAM, encryption, audit logging
- Building with SOC 2 in mind from day one

Must have:

- Python with async web frameworks (FastAPI strongly preferred)
- PostgreSQL and an ORM with real migration experience (SQLAlchemy a plus)
- Hands-on AWS: ECS/Fargate or equivalent, RDS, S3, IAM, Secrets Manager

- Infrastructure-as-code (Terraform or CDK) and CI/CD (GitHub Actions)
- Security fundamentals: token auth, secrets handling, least-privilege IAM

Strongly preferred:

- Redis / background job queues
- HIPAA or other regulated-data experience (PHI, encryption at rest/in flight, audit logging)
- Amazon Bedrock or other LLM-API integration experience
- Docker / containerization

Proposal:

Hey, I recently migrated a healthcare application off a single VPS onto AWS with ECS Fargate, RDS, S3 and Secrets Manager, closed the HIPAA gap through encryption at rest and in transit, audit logging and least-privilege IAM, and had the production environment passing a security review within 6 weeks of starting.

That outcome is exactly what this role needs: a secure AWS landing zone that's production-ready from day one, not retrofitted later.

Two directly relevant production references:

-- Greymind: A production NHS healthcare platform I worked on with HIPAA-adjacent data handling, clinical-grade security controls, role-based access and audit logging: <https://greymind.ai/>

-- Medable: A production clinical trials SaaS I worked on with HIPAA-compliant data handling, encryption at rest and in transit, multi-tenant isolation and compliance-aware architecture: <https://www.medable.com/>

Available immediately. Ready to start with an architecture review of the existing build.

Looking forward to connecting.

Best,

Waleed B.
